Combining Rotation, Scaling and Shift Helps Every Model, but Less Than the Separate Gains Suggest; Stronger Models Gain Less

Joint recipe: rotation ±10°, scaling 0.9–1.1 and shift up to 10%, each with p = 0.5. Every change is paired against the same fold and seed without augmentation.

3D foreground Dice on the original CT grid; Full40 corrected SegTHOR, 4 patient-level folds. (a) uses seed 0 only, because the single transforms were screened on seed 0; (b) uses 4 folds × 3 seeds per model. Source: docs/augmentation_results/per_run.csv.
