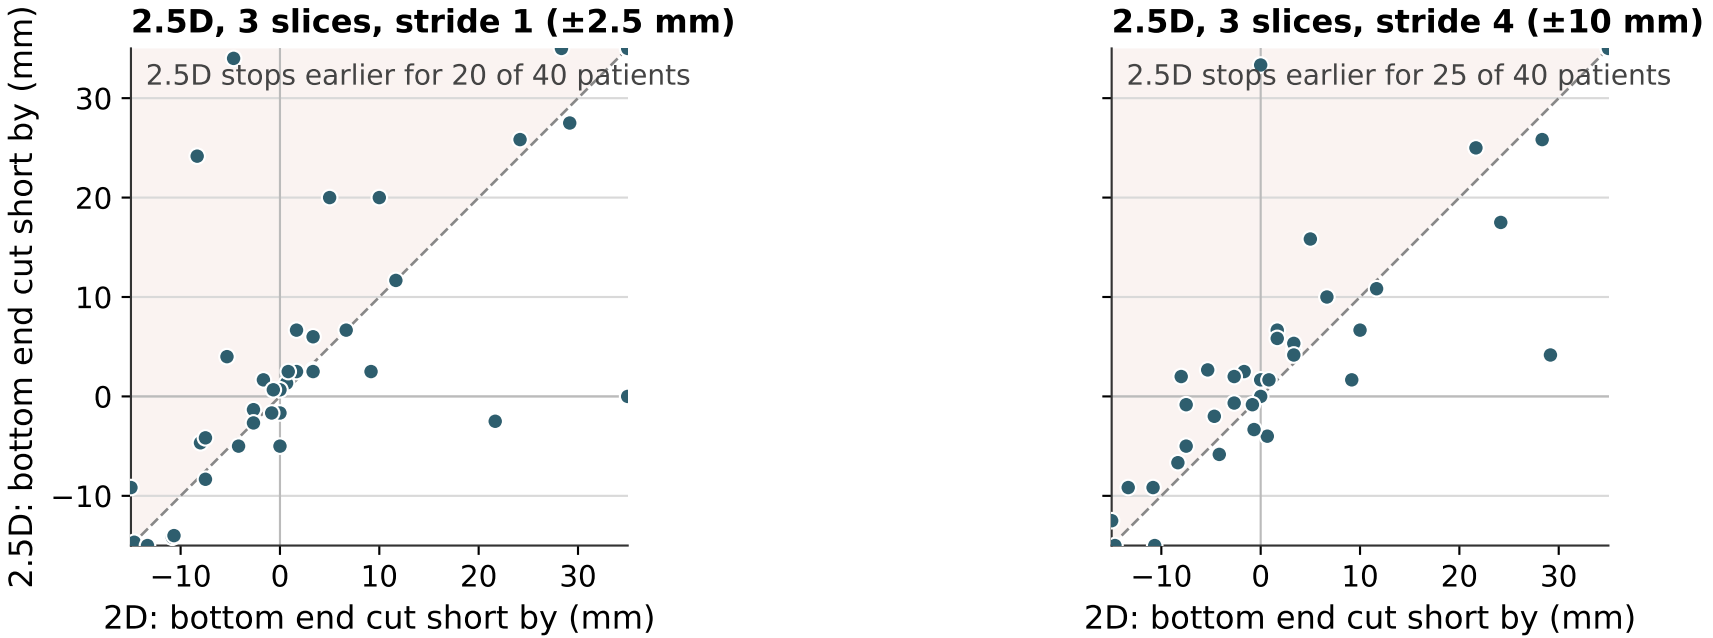
Esophagus Bottom End: 2.5D Stops Earlier for About Half the Patients, as Chance Would Give

Residual-encoder U-Net. How far above the true bottom of the esophagus the prediction stops (negative = runs past it), averaged over 3 seeds. Dots in the shaded half: 2.5D stops earlier than 2D.



Predicted end = bottom slice of the longest unbroken run of predicted slices; original CT grid; values clipped to [-15, 35] mm. Data: data/segthor_train_full/train, corrected labels.
