Esophagus Slices Where 2.5D (Stride 4) Loses the Most Dice Against 2D

Residual-encoder U-Net, seed 0, validation fold of each patient; 3 slices per patient with the largest per-slice Dice drop, cropped ±30 mm around the esophagus. If the 2.5D prediction leans toward the dashed outlines, the neighbour channels are pulling it there.

Data: data/segthor_train_full/train, corrected labels; predictions are the stitched validation volumes on the original CT grid. CT window -160 to 240 HU. Axial view, anterior up, patient left on the right. Dashed outlines are the ground truth on the slices the stride-4 input sees.
