Organs Span 90–224 mm Along z; a 2.5D Input Sees Only ±2.5–10 mm

40 patients aligned at the top of the heart, pooled in 2.5 mm bins. Shaded bands mark each organ's median top and bottom edge, widened by the reach of a 3-slice 2.5D input (c1) at stride 1, 2 and 4.

Data: data/segthor_train_full/train, corrected labels (aorta separate). Presence = share of patients whose scan covers the bin that have the organ in it; pixel share is over the full 512×512 slice, before ROI crop. Heart presence jumps to 100% at z = 0 by construction (it is the anchor). Bins covered by fewer than 10 patients are left out.
