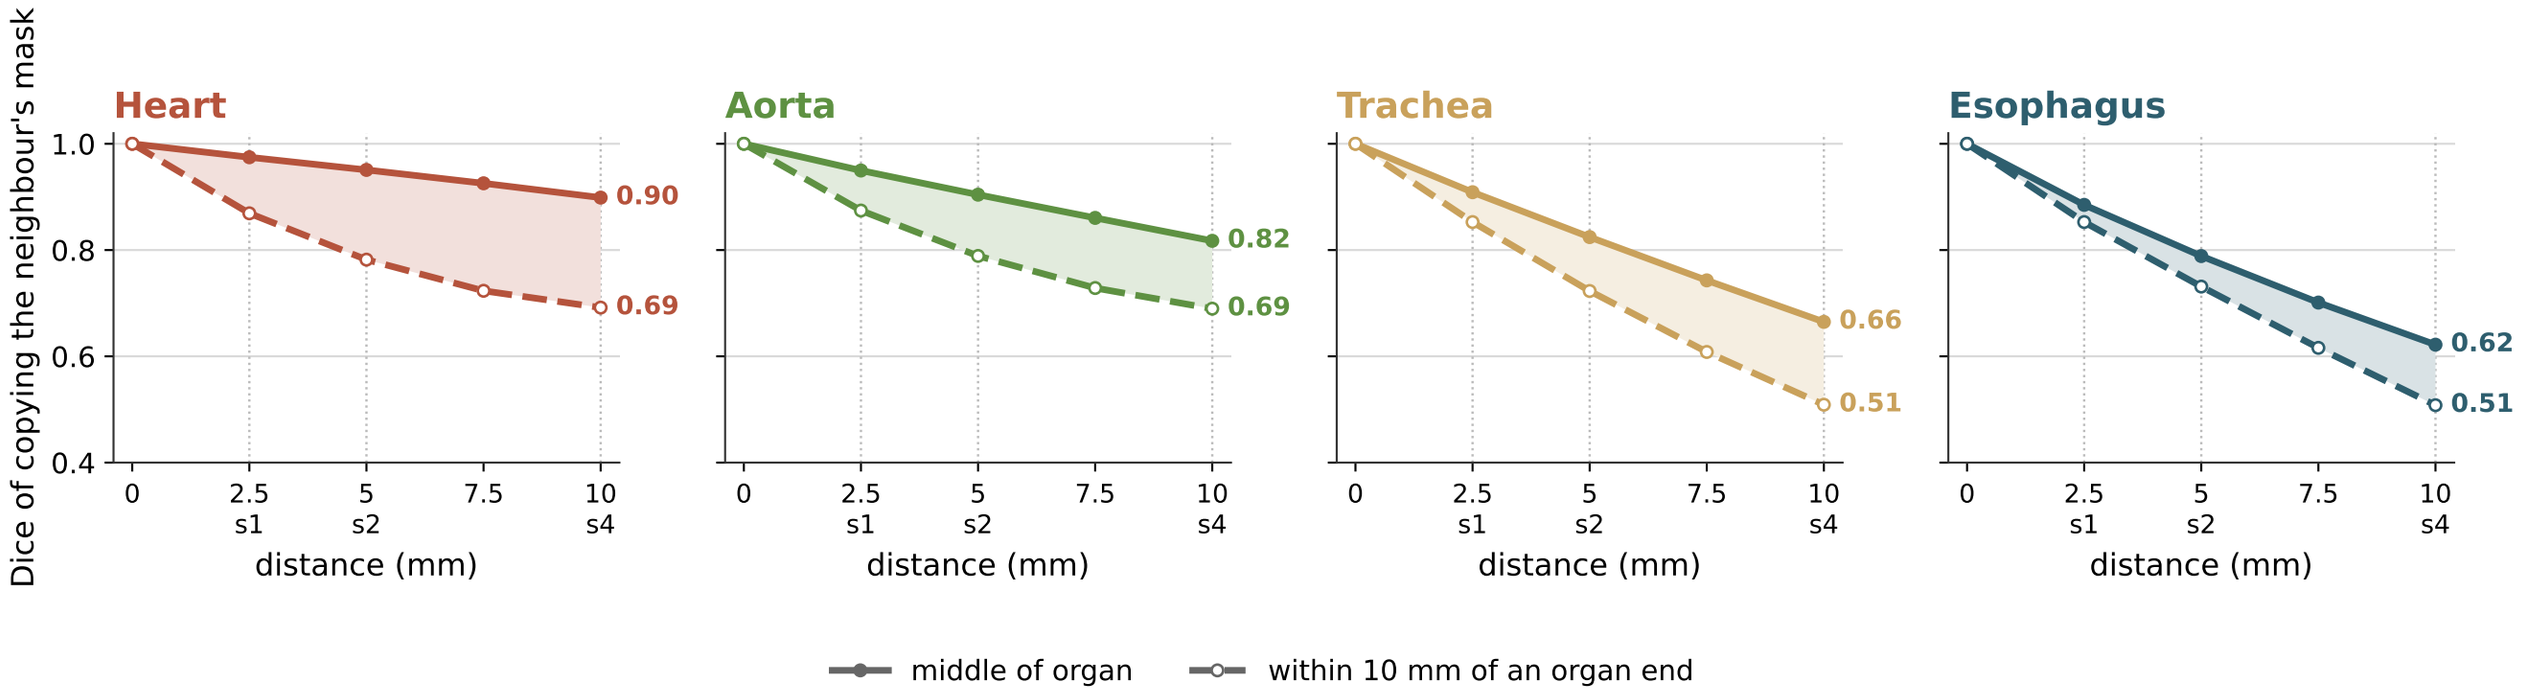
Neighbour Slices Are Near-Copies Inside the Heart; Thin Organs and Organ Ends Change Fastest

How well the organ mask on a slice above or below matches this slice (1 = identical), by distance. Mean over all slices of 40 patients. Dotted lines s1/s2/s4: what a 3-slice 2.5D input sees at stride 1, 2 and 4. The shaded gap is how much more the neighbours differ near an organ end.



Data: data/segthor_train_full/train, corrected labels (aorta separate), labels resampled along z to 2.5 mm (nearest neighbour, as the 2.5D runs). Near an end = centre slices within 4 slices of the organ's own top or bottom slice in that patient, both ends pooled. Dashed lines leave out neighbours past the organ's end (empty, Dice 0: 10/20/30/40% of edge neighbours at 2.5/5/7.5/10 mm for every organ). Neighbours outside the scan are skipped.
