Dice per organ for the loss variants on fold 0

Fold 0 of the 4-fold cross-validation (10 validation patients), ENet. 40-patient SEGTHOR train set (corrected labels), median spacing + HU window + z-score + ROI crop, 25 epochs, Adam lr 5e-4

Dice, 3D on the original CT grid, best checkpoint; each run's value is the mean over the 10 patients of fold 0. All organs = mean of the 4 organs per run. Y-axes differ per organ. One fold only: a few seeds, so differences of the size of the seed spread are not conclusive.
