3D Dice per organ: boundary loss and 2.5D input

ResEnc DS U-Net · strong geometric augmentation · 50 epochs · seed 0 · 4-fold CV, 10 val patients per fold · higher is better

3D Dice on the original CT grid at the best (val-selected) epoch; each point is a patient-averaged fold. Large marker = mean and SD over the 4 folds. Colour = loss, shape = input. One seed and 10 patients per fold: differences of a few thousandths of Dice are within noise. Y-axes differ by organ.
