The Midterm ENet Never Predicts the Heart or Esophagus as One 3D Piece, Though Every Real One Is

Each cell = % of axial slices containing the organ (2D rows) or of volumes (3D rows) with that many connected components. Predictions pooled over all their runs (seeds, and folds where used); ground truth is one volume per patient.

Rules = which neighbours count as touching. 2D (one slice): 4 = sides only, 8 = sides + corners. 3D (whole scan): 6 = faces only, 18 = + edges, 26 = + corners. Ground truth: the 20 patients of the midterm release (data/segthor_part1_corrected, corrected labels). Midterm ENet: Dice + CE, full preprocessing, 25 epochs; its 5 validation patients × 3 seeds, predictions on the original CT grid.
