The New Dataset: Twice the Patients, Cleaner Labels and a Fairer Evaluation

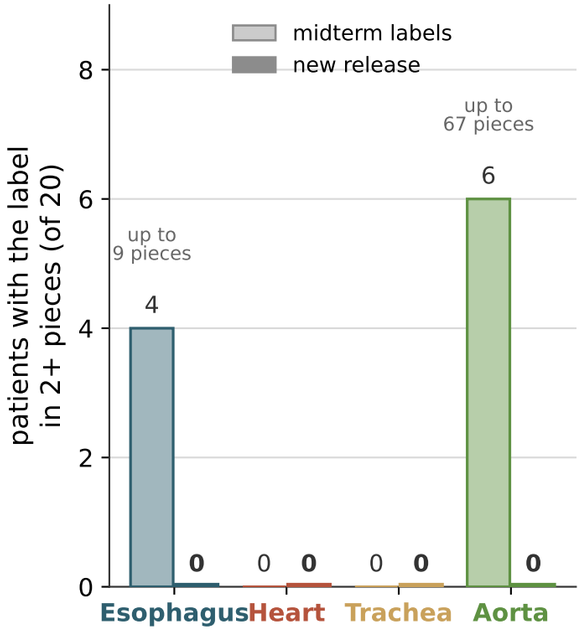

SegTHOR training release, 40 patients with corrected labels (esophagus, heart, trachea, aorta), against the 20-patient midterm data.

(a) Twice the patients, same population

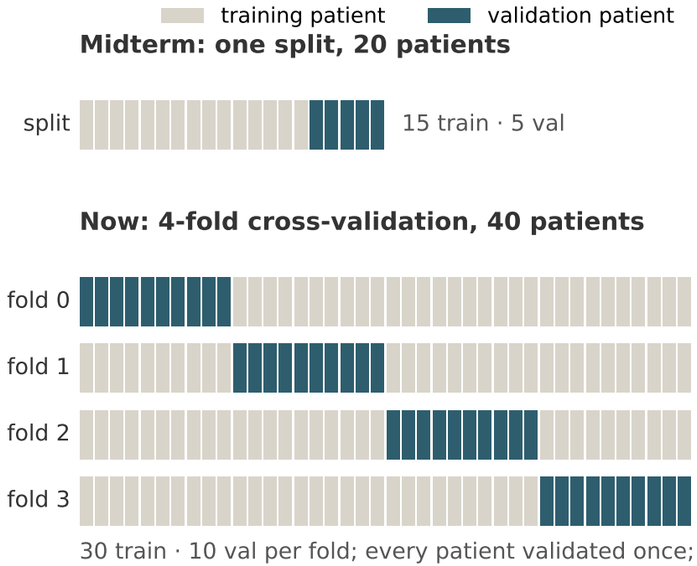

2 of 81 measured properties differ between the two groups ($p < 0.05$);
about 4 would by chance alone. Bar = median.

(b) Cleaner labels for the original 20

(c) A fairer evaluation

(a) organ volume = voxel count × voxel volume. (b) pieces = 3D connected components, voxels touching by a face; midterm labels from data/segthor_part1_corrected, new from data/segthor_train_full. (c) schematic: the actual folds are patient-level splits fixed by seed 0, not consecutive patients.
