

Dice differs far less between seeds ($\sigma \approx 0.002$) than between folds ($\sigma \approx 0.02$)

4-fold cross-validation $\times$ 3 seeds, 40 patients. ENet, 40-patient SEGTHOR train set (corrected labels), median spacing + HU window + z-score + ROI crop, CE + soft Dice loss. 2.5D = the slice and its $\pm k$ neighbours as $2k+1$ input channels, centre slice predicted

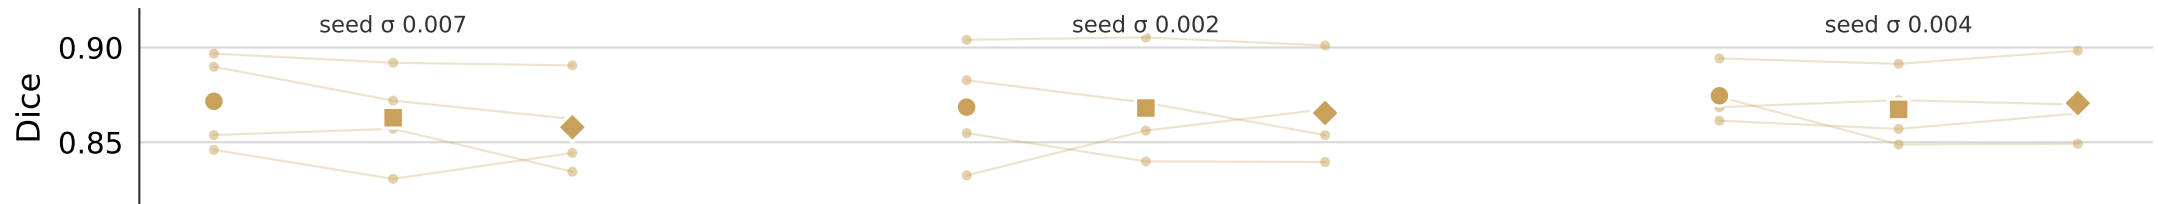

Esophagus

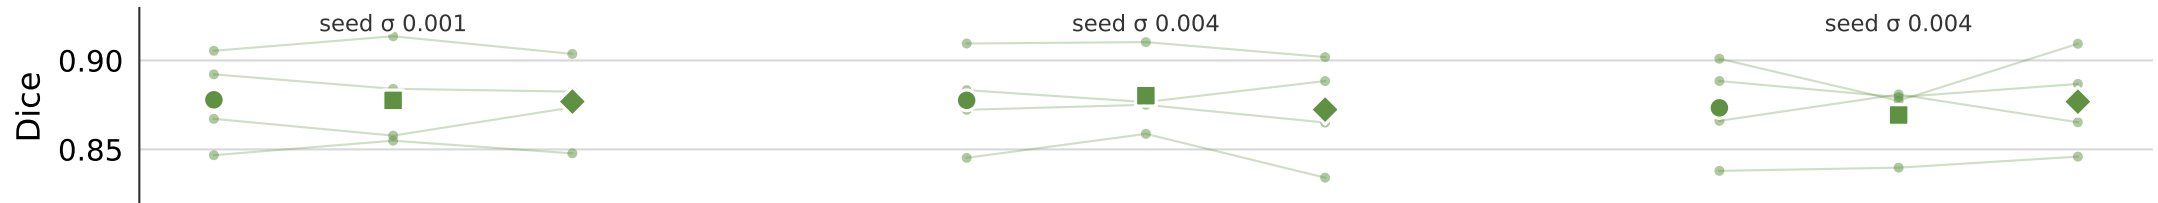

Heart

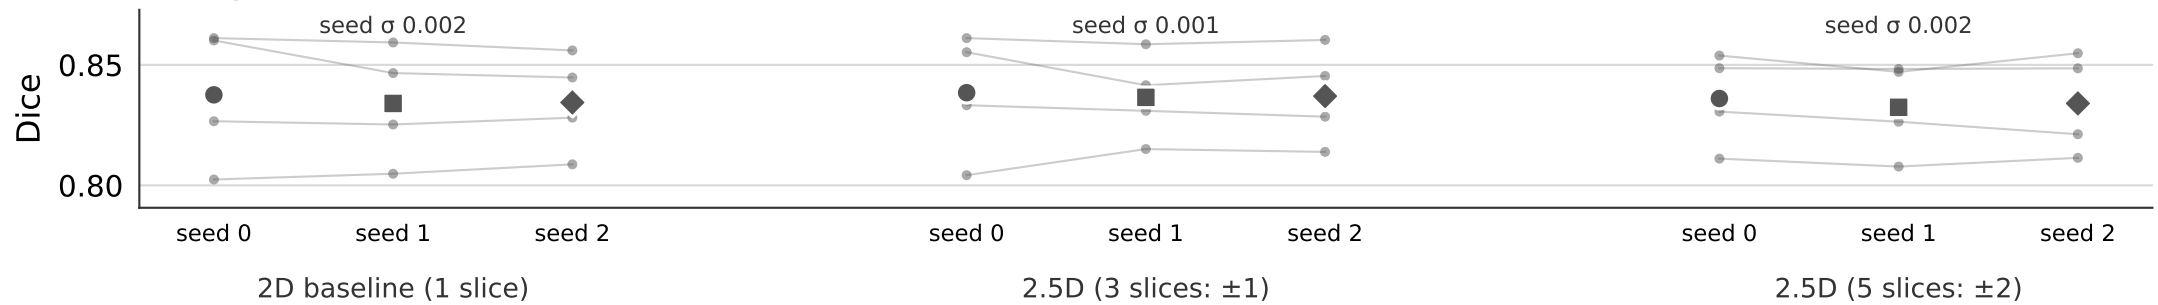

Trachea

Aorta

All organs (mean)

• fold (4 folds, joined across the seeds) ● mean over the folds, one marker shape per seed

Dice, 3D on the original CT grid, best checkpoint; each point is the mean over the patients of one validation fold. seed σ : std over the 3 seeds of the fold-averaged Dice. Y-axes differ per organ.
